

## IN THE SPECIFICATION

Please amend the specification without prejudice, without admission, without surrender of subject matter, and without any intention of creating any estoppel as to equivalents, as follows:

Page 2, paragraph beginning on line 15, please amend as follows:

In particular, the nucleotide sequence may be analysed for one or more positions corresponding to positions 62, 78-86, 138, 139, 144, 198, 204, 211, ~~284~~ 218, 240, 249, 300, 321, 419, 429, 437, 457, 466, 486, 602, 606, 627, 636, 645, 803, 971, 1026, 1044, 1173, 1194, 1251, 1278, 1413, 1495, 1500, 1501, 1512, 1518, 1527, 1595, 1611, 1620, 1627, 1629, 1655, 1832, 1856, 1866, 1871, 1892, 1971, 2026, 2088, 2134, 2187 and 2196 as shown in Figure 1.

Page 2, paragraph beginning on line 30 and continuing on page 3, lines 1 and 2, please amend as follows:

We have also shown that a number of surface protein antigen genes, including *rib*, *alp2* or *alp3* genes, and five mobile genetic elements may be used to molecular subtype GBS. Accordingly, the present invention also provides a method of typing a group B streptococcal bacterium which method comprises determining the presence or absence in the genome of said bacterium of one or more surface protein antigen genes selected from a *rib*, *alp2* or *alp3* gene, and/or one or more mobile genetic elements selected from *IS861*, *IS1548*, *IS1381*, *ISSa4* and *GBSi1*. Preferably, ~~such as~~ such a method is combined with the above methods of the invention.

Page 3, paragraph beginning on line 3, please amend as follows:

The nucleotide sequence analysis step may comprise sequencing said one or more regions. Alternatively, or in addition, the nucleotide sequence analysis step may ~~comprises~~ comprise determining whether a polynucleotide obtained from said bacterium selectively hybridises to a polynucleotide probe comprising one or more of the said regions, preferably to one or more of a plurality of polynucleotide probes corresponding to one or more of the said regions.

Page 3, paragraph beginning on line 18, please amend as follows:

In a second aspect, the present invention provides a polynucleotide consisting essentially of at least 10 contiguous nucleotides corresponding to a region within a *cpsD-cpsE-cpsF-cpsG* gene of a group B streptococcal bacterium, said polynucleotide comprising one or more nucleotides which differ between ~~GBS types~~ group B streptococcal serotypes.

Page 3, paragraph beginning on line 23, please amend as follows:

Preferably the nucleotides which differ between GBS types correspond to one or more of positions 62, 78-86, 138, 139, 144, 198, 204, 211, ~~284~~ 218, 240, 249, 300, 321, 419, 429, 437, 457, 466, 486, 602, 606, 627, 636, 645, 803, 971, 1026, 1044, 1173, 1194, 1251, 1278, 1413, 1495, 1500, 1501, 1512, 1518, 1527, 1595, 1611, 1620, 1627, 1629, 1655, 1832, 1856, 1866, 1871, 1892, 1971, 2026, 2088, 2134, 2187 and 2196 as shown in Figure 1.

Page 4, paragraph beginning on line 1, please amend as follows:

The present invention also provides a polynucleotide consisting essentially of at least 10 contiguous nucleotides corresponding to a region within a *cpsI/M* gene of a group B streptococcal bacterium, said polynucleotide comprising one or more nucleotides which differ between group B streptococcal ~~types~~ serotypes.

Page 4, paragraph beginning on line 7, please amend as follows:

The present invention further provides a polynucleotide consisting essentially of at least 10 contiguous nucleotides corresponding to a region within a *rib*, *alp2* or *alp3* gene of a group B streptococcal bacterium, said polynucleotide comprising one or more nucleotides which differ between ~~GBS protein-antigen-gene~~ Group B streptococcal subtypes.

Page 8, paragraph beginning on line 14, please amend as follows:

Examples of specific primers/probes which target the *alp2*, *alp3* and *rib* genes include the following (SEQ ID NOS 23-37, respectively, in order of appearance):

bcaS1    GGT AAT CTT AAT ATT TTT GAA GAG TCA ATA GTT GCT GCA TCT AC  
bcaS2    CCAGGGA GTG CAG CGA CCT TAA ATA CAA GCA TC

ribA2     AAT ACT AGC TGC ACC AAC AGT AGT CAA TTC AGA AGG

The primer designations correspond to those given in Table 6.

Page 14, paragraph beginning on line 5, please amend as follows:

Detection of binding of GBS genomic DNA to immobilised probes/primers may be performed using a number of techniques. For example, the immobilised probes which are specific to a number of types (capsular polysaccharide gene serotypes, serosubtypes; protein antigen gene subtypes; mobile ~~genetic elements~~ genetic elements subtypes), may function as capture probes. Following binding of the genomic DNA to the array, the array is washed and incubated with one or more labelled detection probes which hybridise specifically to regions of the GBS genome which are conserved. The binding of these detection probes may then be determined by detecting the presence of the label. For example, the label may be a fluorescent label and the array may be placed in an X-Y reader under a charge-coupled device (CCD) camera.

Page 14, paragraph beginning on line 25, please amend as follows:

A number of available detection techniques do not require labels but instead rely on changes in mass upon ligand binding (e.g. ~~surface plasmon resonance-SPR~~ surface plasmon resonance-SPR). The principles of SPR and the types of solid substrates required for use in SPR (e.g. BIAcore chips) are described in Ausubel *et al.*, 1999, *supra*.

Page 14, paragraph beginning on line 32 and continuing on page 15, lines 1-7, please amend as follows:

As discussed above, group B streptococcus (GBS) - *Streptococcus agalactiae* - is the commonest cause of neonatal and obstetric sepsis and an increasingly important cause of septicaemia in the elderly and immunocompromised patients. Thus, the detection methods, ~~probes/primer~~ probes/primers and microarrays of the invention may be used in the diagnosis of GBS infections in pregnant women, elderly and/or immunocompromised patients. The PCR and microarray techniques described herein may be of particular use in routine antenatal screening of pregnant women as well as in diagnosing infections in pregnant women given the increased accuracy and sensitivity compared to conventional identification and serotyping. These methods are also likely to give faster results since it will not generally be necessary to culture clinical

samples to obtain enough material. Further, the molecular techniques can be used in most laboratories without the need for specialist expertise or reagents.

Page 21, paragraph beginning on line 33, please amend as follows:

There were five isolates belonging to serosubtype III-3, which contained the repetitive sequence and were identical with serosubtype III-1 at three variable sites (139, 144, and 300) and with serosubtype III-2 at four (204,321, 626 and 1629). Serosubtype Serosubtype III-3 differed from both serosubtypes III-1 and III-2 at seven sites (486, 1026, 1413, 1512, 1518, 1527, and 2134). These seven sites in serosubtype III-3 were identical with the corresponding sites of MS Ia.

Table 6 starting on page 58, please amend as follows:

Notes.

#For sequencing use only, not entirely specific for rib gene.

1. The primer T<sub>m</sub> values are provided by the primer synthesiser (Sigma-Aldrich).
2. Numbers represent the numbered base positions at which primer sequences start and finish (numbering start point "1" refer to the start point "1" of corresponding GenBank accession number, of which there are two for some sequences).
3. Underlined sequences show bases added to modify previously published primers.
4. Primers designed by us for this study.
5. Mawn *et al.*, 1993.
6. Maeland *et al.*, 1997.
7. Maeland *et al.*, 2000.
